

CASE STUDY

STENA LINE

Stena Line have a decentralised operational management system which empowers their senior masters and has improved their efficiency. However they recognised that they needed a centralised safety management system (SMS) which would ensure consistent safety management and shared best practices across their port offices and ships.

Regs4ships developed their innovative Company Regs system as a result of this requirement which incorporated the flag state regulations into a ship's SMS, so that both are in a digital format.

Regs4ships system enables regulatory changes to be immediately reflected in the SMS so that procedures can be amended both to ensure compliance as well as a record of due diligence.

A major benefit of the service is that the SMS can be formatted so that ships officers can determine their individual responsibilities for each aspect of the ship's operation without having to search through the whole of the SMS.

It can transform the SMS into a live and responsive on-board system which also provides feedback to the company offices ashore and involves them in responding to management issues on their ships.

Regs4ships provided the combined maritime and IT expertise to develop the system and we also worked with Stena Line staff to re-formulate their SMS and administer it in the new format.

"By responding to the specific problems of one customer we have developed general solutions for other shipping companies"

Richard Eastham, Regs4ships Director
